

USER MANUAL
PEN-01 ADAPTER

TO PENDRIVE

### 1. General description

Adapter enables to save data send from measurement device (for example from scale) to USB memory pendrive. Data is saved in a file, which can be readout after disconnecting the pendrive and connecting it to computer. To readout file any text editor can be used. Copying file can be done by typical computer programs or Windows tools.

- one-way communication with any device equipped with RS232C connection
- possibility of saving a timestamp of incoming data
- possibility to connect pendrive with any capacity using USB connection
- supply from RS232C interface or from external adaptor

### 2. <u>Set</u>

Basic kit includes:

- 1. Adapter PEN-01 to pendrive
- 2. External adaptor (if necessary)
- 3. Pendrive
- 4. Manual
- 5. Cable WP-1 (option)

### 3. Technical specification

| Туре        | PEN-01   |
|-------------|--|
| Interfaces  | RS232C (DB-9), USB (type A)  |
| Signaling   | <ul> <li>USB control diode (continuous lighting – ready to write,<br/>blink – during transmission)</li> <li>RS232 control diode (continuous lighting – power supply,<br/>blink – during transmission)</li> </ul> |
| File system | FAT12 / FAT16 / FAT32  |
| Supply      | 12 VDC 100mA (using RS232C or external feeder)   |
| Dimensions  | 72x41x24mm   |
| Weight      | 40g  |

RS232C interface diagram (PEN-01)

## 4. Options of connecting adapter to measurement equipment and pendrive

Standard option (with external feeder)

Option with USB extension conduit (supply by RS232C bond)

#### 5. Adapter configuration

After connecting pendrive to adapter, adapter tries to open "config.txt" file and readouts configuration parameters. If there isn't configuration file in the pendrive main catalog, it will be created and it will set default parameters. To change the parameters, user should edit "config.txt" file using computer and a text editor.

#### 5.1 Configuration by using PEN software

User can create "config.txt" file by using PEN. The software creates file automatically.

5.2 Configuration by edition of file (only for advanced users)

Manual editing of configuration file enables to change all necessary parameters. Each line of a configuration file should be written in a following way: "PARAMETER\_NAME = VALUE". If particular line contains such a sequence of characters: "//" it means that everything following this sequence is a comment and won't be interpreted by PENDRIVE interface as a parameter name or value. Values of parameters can be placed directly after "=" character or can be placed in the quotation marks (if parameter contains white spaces, value of this parameter has to be put in quotation marks).

If the configuration file doesn't contain particular parameter or the value of this parameter is incorrect, then the value of the parameter will be set to default.

It is possible to use control codes in configuration file by using special escape character ('\' character). This character causes following it characters to be interpreted in a different way than usual. Possible escape sequences are:

| \b  | <ul> <li>Backspace;</li> </ul> | (same as \x08)                  |
|---|--------------------------------|---------------------------------|
| \f  | <ul> <li>FormFeed;</li> </ul>  | (same as \x0c)                  |
| \n  | - Newline;                     | (same as \x0a)                  |
| \r  | - Carriage-Return;             | (same as \x0d)                  |
| \t  | - Horizontal Tab;              | (same as \x09)                  |
| \x<2-hex-digits>                            | - code of character            | (e.g. \x4e means 'N' character) |
| \X<2-hex-digits>                            | - same as above                |                                 |
| //  | - means '\' charact            | er                              |
| \"  | - means "" charac              | ter                             |
| <pre>\<anything-else></anything-else></pre> | - treated as if there          | e where no '\' character        |

Maximum size of configuration file is 1KB.

Parameters that can be modified:

Example:

TIME = 08:12:45

| Name:        | РАТН  |
|--------------|---|
| Description: | Path to file plus file name (8.3 format) where transmission is saved. If the file doesn't exist, it will be created. If it exists transmission will be added at the end of file.<br>Parameter "PATH" can have following sequences:<br>\Y - year - added two last digit of year<br>\M - month<br>\D - day<br>\H - hour<br>\N - minute<br>\S - second   |
| Default:     | /LOG.TXT  |
| Example:     | PATH = /FOLDER1/ RESULTS.TXT  |
| Nama         |   |
| Name.        | AUTO_NAME   |
| Description: | Parameter can have "YES" or "NO" value. If "NO" is set, it means that after<br>taking out the pendrive and connecting it once again, RS232 transmission<br>will be saved to the same file defined by PATH parameter. If "YES" is set<br>each taking out and in will create new file where the transmission will be<br>saved. New files names will be created using file name (PATH parameter)<br>and successive numbers for example: LOG00001.TXT, LOG00002.TXT,<br>LOG00003.TXT etc. If the numbers run out, instead of next number, 'X'<br>sign will show up. |
| Default:     | NO  |
| Example:     | AUTO NAME = YES   |
|              |   |
| Name:        | BAUD  |
| Description: | Setting RS232 transmission speed. (Available: 2400; 4800; 9600; 14400; 19200; 38400; 56000; 57600; 115200)  |
| Default:     | 4800  |
| Example:     | BAUD = 9600   |
|              |   |
| Name:        | DATE  |
| Description: | If this parameter is present in configuration file, date will be set and this parameter will be preceded with <i>"//"</i> signs to avoid changing data during next pendrive inserting.<br>Format: YYYY-MM-DD  |
| Default:     | Data doesn't change   |
| Example:     | DATE = 2010-04-11   |
|              |   |
| Name:        | TIME  |
| Description: | If this parameter is present in configuration file, time will be set and this parameter will be preceded with <i>"//"</i> signs to avoid changing data during next pendrive inserting.<br>Format: GG:MM:SS.   |
| Default:     | Time doesn't change   |

| Name:        | COMMAND   |
|--------------|---|
| Description: | Command which should be sent through RS232 port at specified intervals.<br>Maximum size of command is 20 characters. Empty command means:<br>don't send anything.   |
| Default:     | Empty   |
| Example:     | COMMAND = SI  |
|              |   |
| Name:        | INTERVAL  |
| Description: | Interval at which command should be sent (expressed in seconds). If this parameter equals zero it means that command won't be sent.   |
| Default:     | 10  |
| Example:     | INTERVAL = 20   |
|              |   |
| Name:        | ECHO  |
| Description: | This parameter determines whether command sent to RS232 port should be logged to file or not. Allowed values: YES or NO.  |
| Default:     | YES   |
| Example:     | ECHO = NO   |
|              |   |
| Name:        | LOG_DATE  |
| Description: | This parameter determines whether transmission date should be stored<br>and sets date format. Allowed values:<br>YES – transmission date in PL format e.g. 2015-03-20,<br>PL - as above,<br>US - transmission date in USA format e.g. 03/20/2015,<br>EU – transmission date in format e.g. 20-03-2015,<br>NO – without transmission date. |
| Default:     | NO  |
| Example:     | LOG_DATE = YES  |

| Name:        | LOG_TIME   |
|--------------|--|
| Description: | This parameter determines whether transmission time should be stored and sets time format. Allowed values: |
|              | YES – as above,  |
|              | EU – as above,<br>US – transmission time in format e.g. 2:32:58pm,   |
|              | NO – time isn't stored.  |
| Default:     | NO   |

| ///A | X | IS |
|------|---|----|
|      |   |    |

| Example:     | LOG_TIME = YES   |
|--------------|--|
|              |  |
| Name:        | TRIG_TOKEN   |
| Description: | This parameter specifies sequence of characters which should make<br>timestamp to be inserted in a log file. Maximum size of this sequence is 20<br>characters. Timestamp will be placed in a log file behind recognized<br>sequence of characters. Empty "TRIG_TOKEN" means: There is no<br>sequence of characters which should make timestamp to be inserted in a<br>log file.   |
| Default:     | \r\n (\r – code 13; \n – code 10) (ENTER)  |
| Example:     | TRIG_TOKEN = "" (empty)  |
|              |  |
| Name:        | TRIG_PERIOD  |
| Description: | This parameter specifies minimum period of time which has to elapse after<br>last timestamp to cause that next data reception will make timestamp to be<br>inserted in a log file. If, during reception of byte of data through RS232 port,<br>PEN-01 finds that time which elapsed after last timestamp is larger than<br>"TRIG_PERIOD" it will insert next timestamp to the log file just before this<br>byte. If this parameter equals zero it means that elapsing time won't make<br>timestamp to be placed in the log file. |
| Default:     | 5  |
| Example:     | TRIG_PERIOD = 10   |
|              |  |

| Name:        | PROTOCOL   |
|--------------|--|
| Description: | <ul> <li>This parameter term which protocol can be understandable by interface:</li> <li>NONE – any protocol are choose, all bytes are writing to file</li> <li>E1 – protocol Eltron, identifier of label will be write to file,</li> <li>E2 – protocol Eltron, identifier of label will not be write to file, indication will be write to file name "identifier of label will not be write to file, indication will be write to file name "identifier of label.txt" (independently of PATH setting),</li> <li>PARAMx (x can be set from 1 to 8) – saving data to different files depending on chosen parameter. Parameter number is related to active positions in <i>Print</i> function (in balances). If second position send from scale is product identification number and user sets protocol to PARAM2 then separate measurements files will be created depending on product ID (created files will have different product ID's as their names).</li> </ul> |
| Default:     | NONE   |
| Example:     | PROTOCOL = PARAM2  |

Configuration file example:

// \*\*\* CONFIG FILE VER. 46 \*\*\*
PATH = /LOG.TXT // Path to log file
AUTO\_NAME = NO // Allowed values: YES;NO;

BAUD = 9600 // Allowed values: 2400;4800;9600;14400;19200;38400;56000;57600;115200;

//DATE = 2010-01-01 // Date format: YYYY-MM-DD
//TIME = 08:00:00 // Time format: HH:MM:SS

LOG\_DATE = YES // Allowed values: YES;NO;PL;EU;US; LOG\_TIME = YES // Allowed values: YES;NO;PL;EU;US; TRIG\_TOKEN = "\r\n" // Max 20 characters TRIG\_PERIOD = 0 // 0 - 999999 [sec]

COMMAND = "SI\r\n" // Max 20 characters INTERVAL = 0 // 0 - 999999 [sec] ECHO = NO // Allowed values: YES;NO;

PROTOCOL = PARAM1 // Allowed values: NONE;E1;E2;E3;PARAM1-PARAM8; CONFIRMATION = NO // Allowed values: YES or NO

# 6. Signaling

DIODA\_USB – diode closer to USB interface DIODA\_RS232 – diode further from USB interface

After diode supply is on both diodes light for about 0,5 second.

#### DIODA\_RS232

| Event / State                                       | Diode RS232 |
|---|-------------|
| "Adapter" isn't supplied.                           | Light off   |
|   |             |
| "Adapter" is supplied.                              | Light on    |
|   |             |
| Transmission is in progress on RS232 receiving line |             |

DIODA\_USB

| Event / State   | Diode USB |
|---|-----------|
| Pendrive is disconnected or unidentified or full  | Light off |
| Pendrive is ready   | Light on  |
| Pendrive with configuration file is connected and all parameters are recognized correctly   |           |
| Pendrive without configuration data. Configuration file has been created with default data.   |           |
| Pendrive with configuration file but one of the following problems occured:   |           |
| <ul> <li>configuration file is too big</li> <li>unidentified parameter in configuration file</li> <li>identified parameter has incorrect value</li> </ul> |           |
| Data portion saved on Pendrive  |           |
| Data portion saved on Pendrive but there is no free space available   |           |

### 7. RS232C commands

The whole transmission from RS232 port is saved on Pendrive. Exception is situation when byte with 0x10 value shows up. Device recognizes this as a marker – successive bytes are interpreted as a command for the device. Device ends interpreting successive bytes as command after 0x10 sign shows up again. Following command are recognized: I(/)– main catalog listing o(/plik.txt) – readouts "plik.txt" file by RS232 interface d(2010-04-11) – data setting c(08:00:00) – time setting
